

As a horticulturist and organic educator, I always start with establishing the soil health before advising any of my clients to plant their gardens. Promoting fertility and feeding the soil organisms is a major part of a living organic soil. I've found Organic Xtra fertiliser to be perfect for improving soil health and vitality and increasing crop yields in home gardens.

I've used Organic Xtra for many years now on my own garden and at the Brisbane Botanic Gardens at Mt Cootha where I plant up the vegie patch for my workshops. Our harvests are legendary! Using Organic Xtra has been a mainstay in these gardens for all that time and I can see evidence of increased soil fertility, strong plant growth and increased organic matter, all essential for WOW factor gardens.

Don't stop at garden beds though. A little added to your potted herbs and fruit trees is terrific for them too.

In 2013 I'm delighted to be using the product at my Community Garden workshops and in St Josephs Kangaroo Point School garden. Young green thumbs will be learning first-hand about how Organic Xtra will help them to create fertile soil, teeming with microscopic life and how this supports plants that the children will harvest for their own lunches and snacks.

I can thoroughly recommend Organic Xtra for all organic gardens big or small, in pots or in the ground. You can check out my website to see some of the gorgeous garden results, join in an organic workshop or check the Ecobotanica facebook page for ideas on how to use Organic Xtra in your garden
